

SAS Project Submission

Category-1

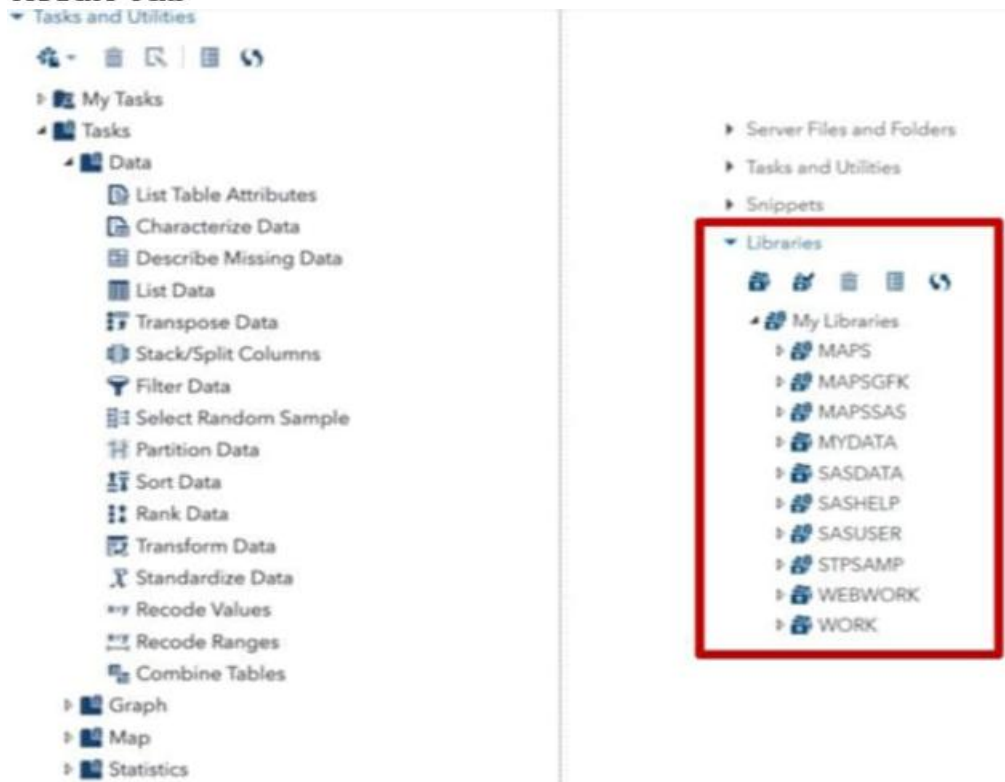

Q1) Explain the detail explanation on the below mentioned image.

CODE Window

LOG window

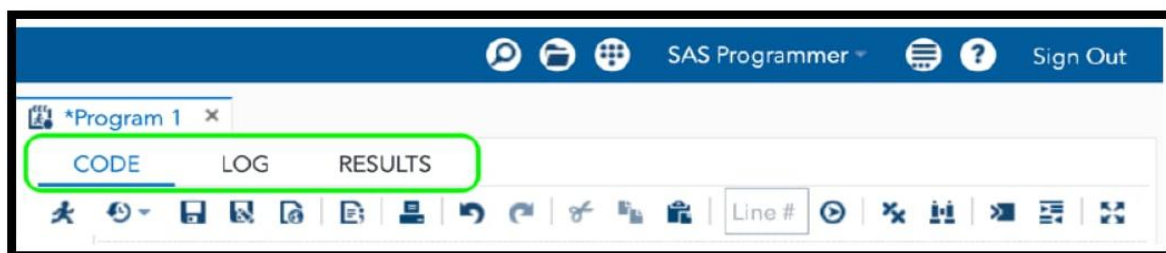

Result Tab

1Ans) The above image shows navigation pane of SAS studio. This panel contains different windows such as:

- **Tasks And Utilities:** Under this window user can access various point and click functions based on project need, such as Graphs, Statistics, Linear Models, Data etc. And under Utilities user can open a new code window for manual entering of a program.
- **Snippets:** Consists of lines of code which user can use directly when required instead of typing frequently used SAS code.
- **Libraries:** Used to store permanent and temporary datasets. Under this window user can create new library or delete an existing library. Assigning different libraries to different datasets makes it easier for user to work on different projects with multiple datasets at once. Work, Maps, Sashelp, Sasuser, Sasdata etc are libraries which store temporary datasets.
- **File Shortcuts:** used to give aliases to files or datasets. Makes it easier to call or specify datasets based on user convenience

Q2) Explain the detail explanation on the below mentioned image.

Icon	Tooltip
	Run all or selected codes
	Submission history
	Save program
	Program summary
	Clear all code

2Ans) Code, log and results window in Navigation pane.

- **Code Window:** Under this window user can type or edit a new program. Under this there are different types of tools with unique icons and functions.
 -  **Run Icon** runs the program or F3 key has the same function as run icon.
 -  **Submission History** allows user of access previously submitted programs in the session.
 -  **Save Program** saves the current program into a desired location and user can retrieve this saved program when ever needed. User can save a program with a convenient name.
 -  **Program Summary** upon clicking this icon in SAS studio it gives a quick summary of the program such as dataset name, list of procedures used (PROC SQL, proc print), or libraries used in current program.
 -  **Clear Code** icon clears all lines of entered program.
- **Log Window:** Important element in SAS studio, it track's the execution of your code and shows details like errors, warnings, notes, time took to run the program etc. User can identify error in the program and can edit in code window. It shows execution time and resources used in the program. It will also show the lines executed and the location where output is stored. Log Window also shows user ID, time and date of executed program, server, platform and version of SAS studio.
- **Result Window:** After successful running of a program result is shown under this window. It gives us a visual and formatted display of your results. In this window user can print results or download results in HTML, RTF or PDF

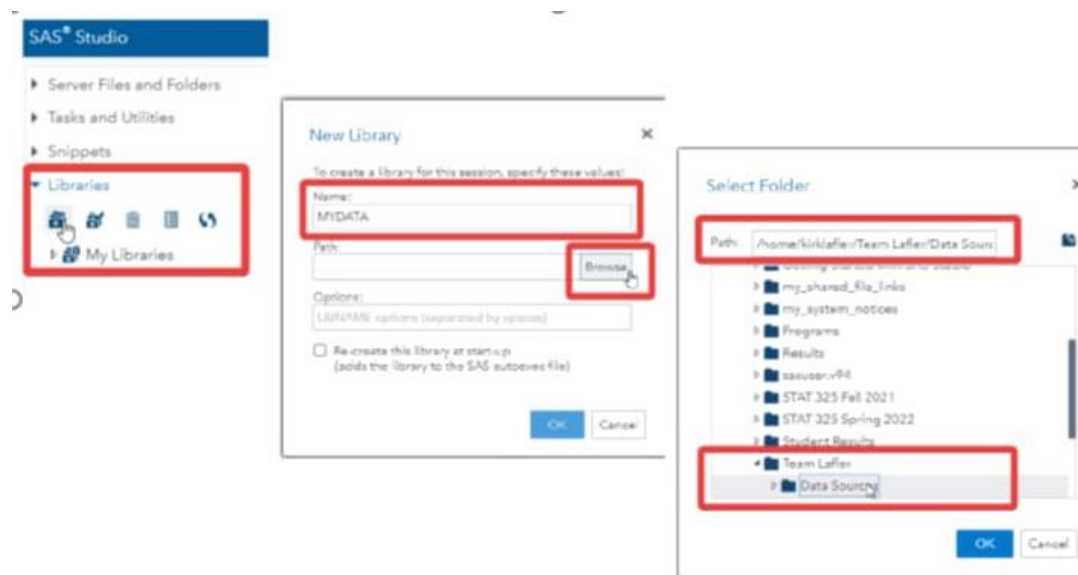

format. Another special feature of result window in SAS Studio is user can directly mail the output result via Gmail.

Q3) What is the concept called as Temporary versus Permanent SAS Datasets?

3Ans) Temporary SAS Datasets: Datasets which are temporary and gets deleted after a session. Stored in SAS libraries such as work, SASUSER, SASHELP, maps etc.

Permanent SAS Datasets: Datasets are permanent and doesn't get deleted even after a session. User should create a new library with its path set to computer's desktop.

Q4) Explain about Assigning a New SAS Library? What is the main function of Maintain the SAS Library?

4Ans) To assign a new SAS library, user needs to use “Libname” Statement in code window and create new folder in computer to store the dataset. Path should be set between library and folder. Dataset stored under this library is stored as permanent dataset.

Maintaining libraries in SAS makes easier for user to work on different projects with different datasets at once in a single session by assigning different libraries to different datasets. Permanent datasets also can be stored by maintain SAS libraries.

---THE END---
